# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Introduction:

- **Occupancy:** Mixed use, Office and Commercial
- **Size:** 12 floors, 59,000 sqft per floor  
-157.5' total height
- **Dates:** April 2011 – 2014

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Gravity System:

- 8 1/2" Two way post tensioned slab with mild steel
  - 1/2" 7-wire strand grade 270 ksi
  - #4 and #5 mild steel at columns
  - F'c of 5000 psi
- Banded tendons run E-W (810 kips ) draped profile
- Distributed tendons run N-S (20 kips/ft spaced @ 6') draped profile
- 24"x24" typical columns with 8 #8 bars and #3 ties @ 16", F'c changes with height (8ksi-6ksi)
- 7 1/2" Drop panels and Shear capitals

Tendons

Columns

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

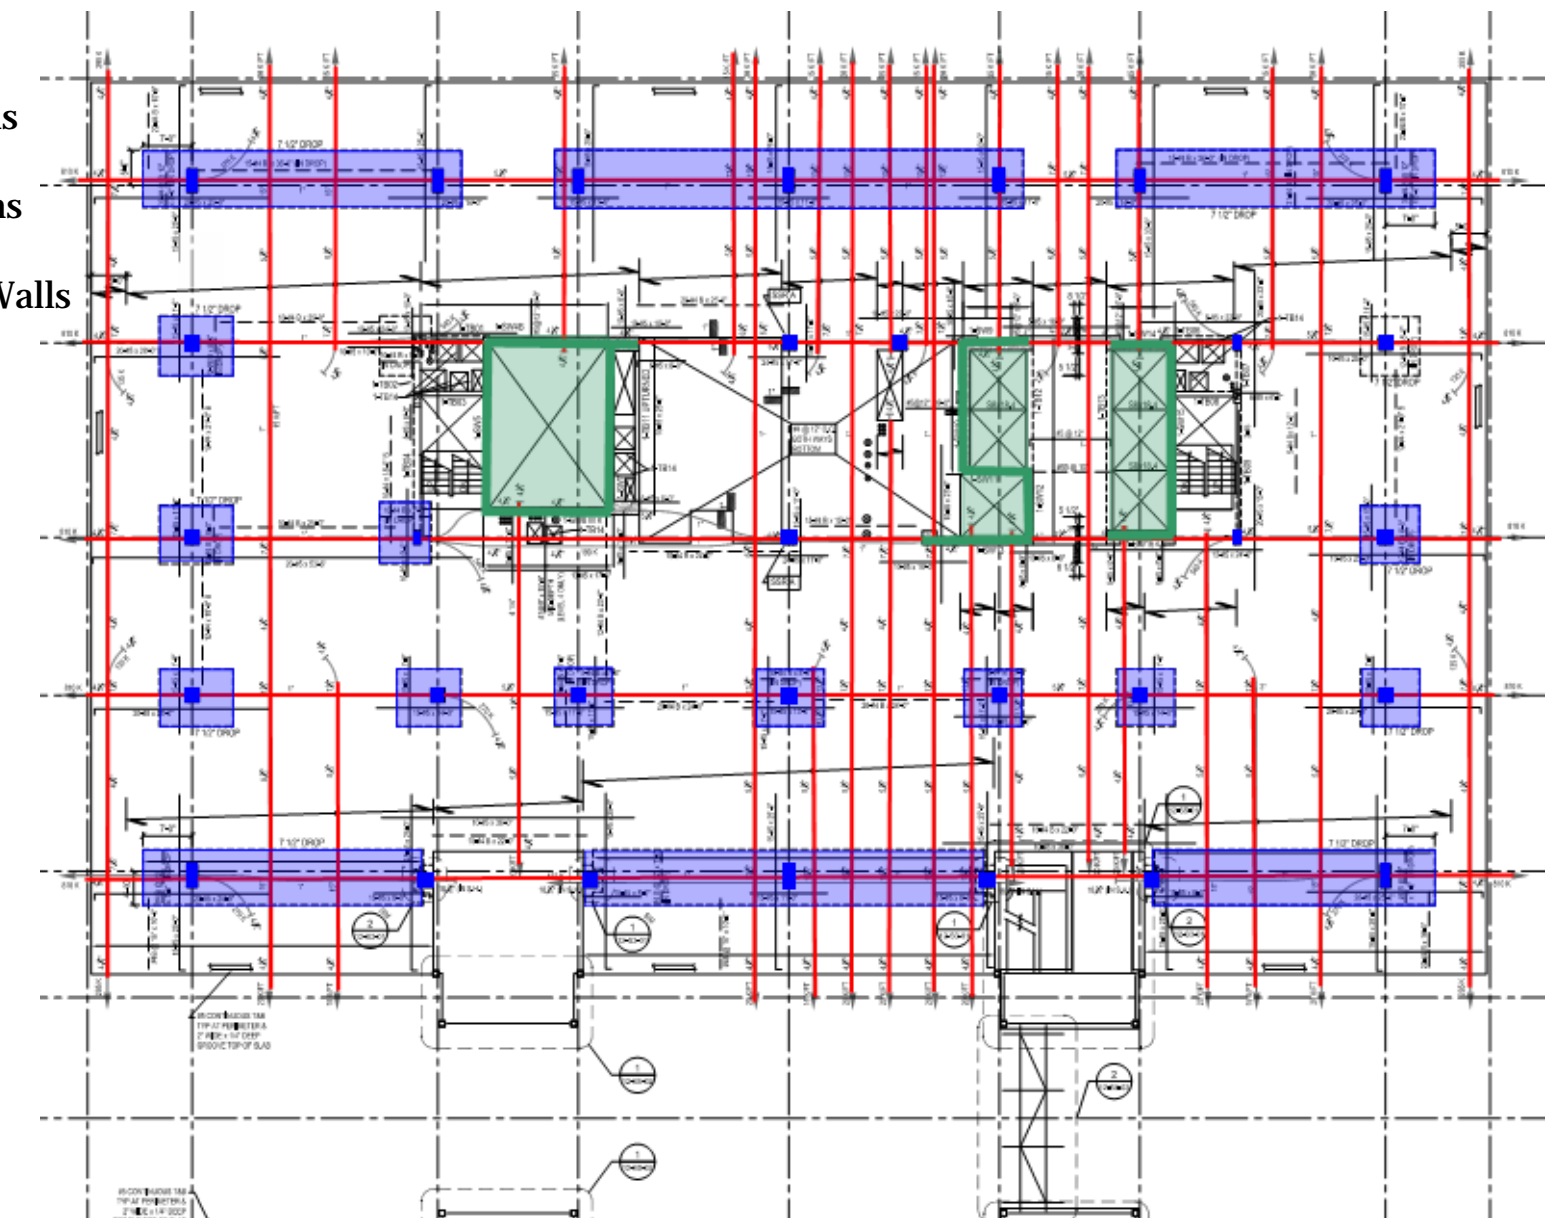

### Lateral System:

- Reinforced Concrete Shear Walls with boundary elements.
- Shear Walls that run N-S are 10" thick  
Shear Walls that run E-W are 12" thick  
Both have either #4 or #5 bars at 12" for both longitudinal and transverse reinforcement.  
Typical boundary elements are 12#7 or 8#8 bars  
F'c changes with height (same as columns)

Tendons

Columns

Shear Walls

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Structural Depth:

- Redesign of the gravity system into a two way flat plate
- Redesign of shear walls for new load
- Blast design for interior and exterior explosion
- Progressive Collapse for interior explosion

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Proposed Gravity System:

- Gravity redesign into a two way flat plate
  - 15' overhangs are too large
  - Add perimeter beams
  - Add perimeter columns

### Perimeter Columns

### Perimeter Beams

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Proposed Gravity System:

- Gravity redesign into a two way flat plate
  - 15' overhangs are too large
  - ~~Add perimeter beams~~
  - Add perimeter columns

### Perimeter Columns

### Perimeter Beams

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Proposed Slab System:

- Two way flat plate
  - Direct Design method
  - Designed for controlling interior and exterior bay

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Proposed Slab System:

- Two way flat slab
  - Direct Design method
  - Interior Bays #9 @ 12" within 7' of column  
#7 @ 12" everywhere else
  - Exterior Bays #8 @ 12" within 5' of column  
#5 @ 12" everywhere else
- Top reinforcement @ 6"
- F'c of 4000 psi
- 11" thick slab

Top and Bottom Reinforcement

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Slab System Verification:

- Verification
  - Reinforcement designed by hand matched that designed by spSlab

13 #8 spaced at 12" within  
a 13' wide strip = #8 at 12"

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

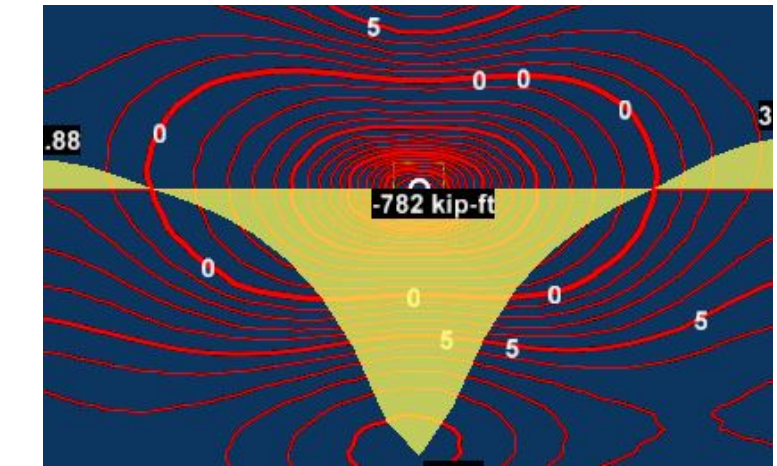

## Conclusion

### Slab System Verification:

- Verification
  - Reinforcement designed by hand matched that designed by spSlab
  - Moments at the same location were within 10% of each other

### RAM Concept

### Hand Calcs

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

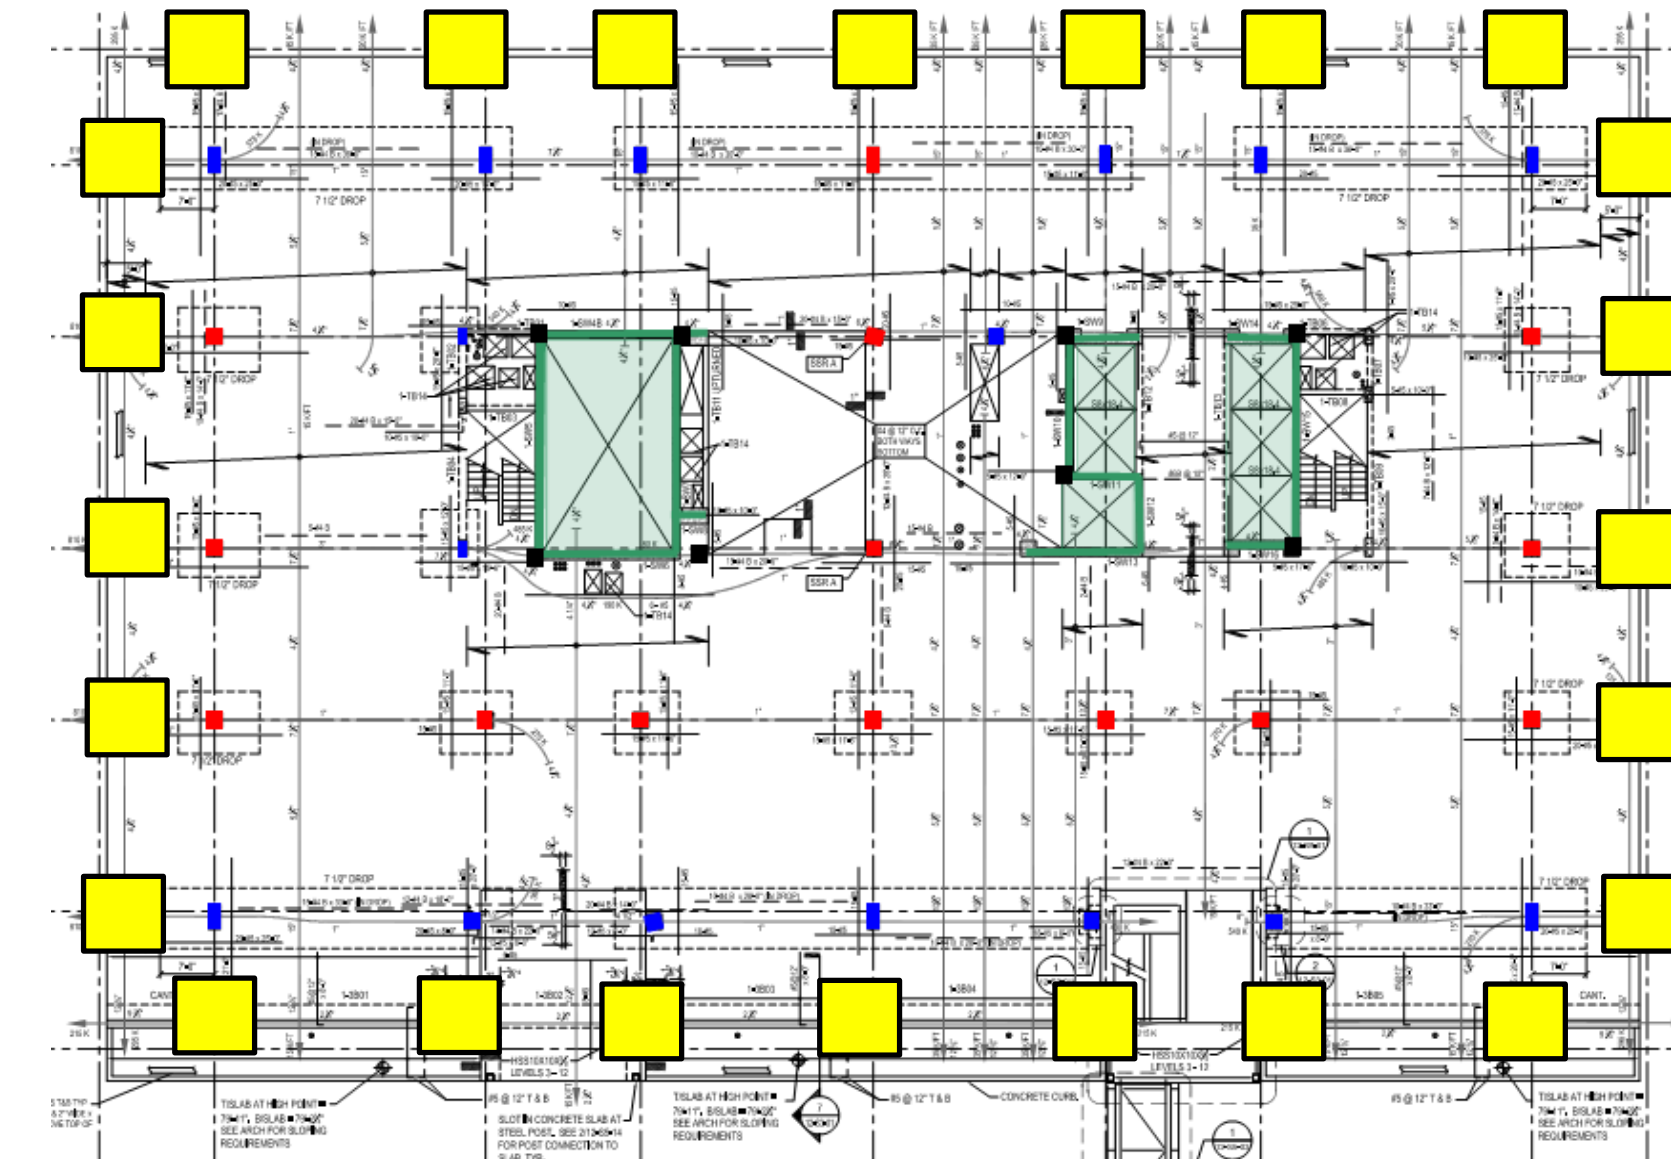

## Conclusion

### Proposed Gravity System:

- Three different columns were designed to meet the new loads  
-16"x16" with 8#6 bars #3 stirrups at 12"

16"x16"

# One City Center

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Proposed Gravity System:

- Three different columns were designed to meet the new loads
  - 18"x18" with 8#6 bars #3 stirrups at 12"
  - 24"x24" with 8#8 bars #4 stirrups at 12"

24"x24"

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

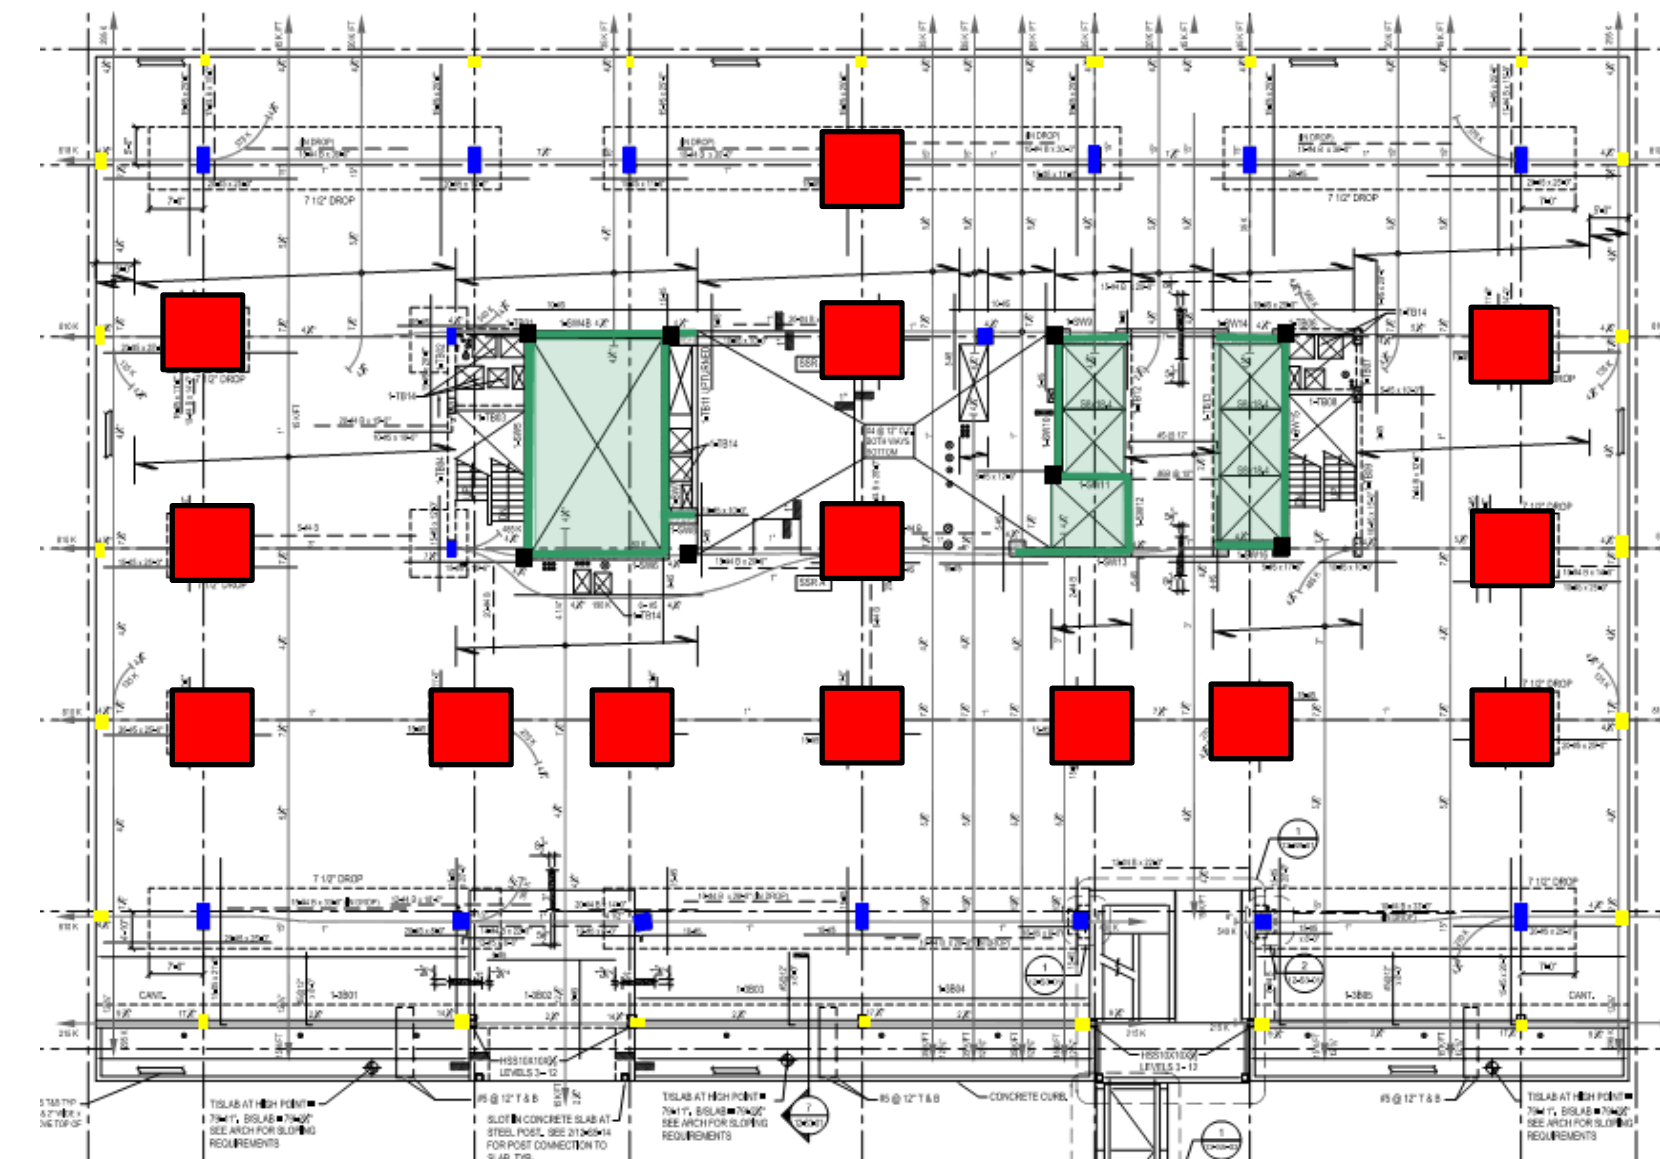

## Conclusion

### Proposed Gravity System:

- Three different columns were designed to meet the new loads
  - 18"x18" with 8#6 bars #3 stirrups at 12"
  - 24"x24" with 8#8 bars #4 stirrups at 12"
  - 24"x30" with 12#8 bars #4 stirrups at 12"

24"x30"

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

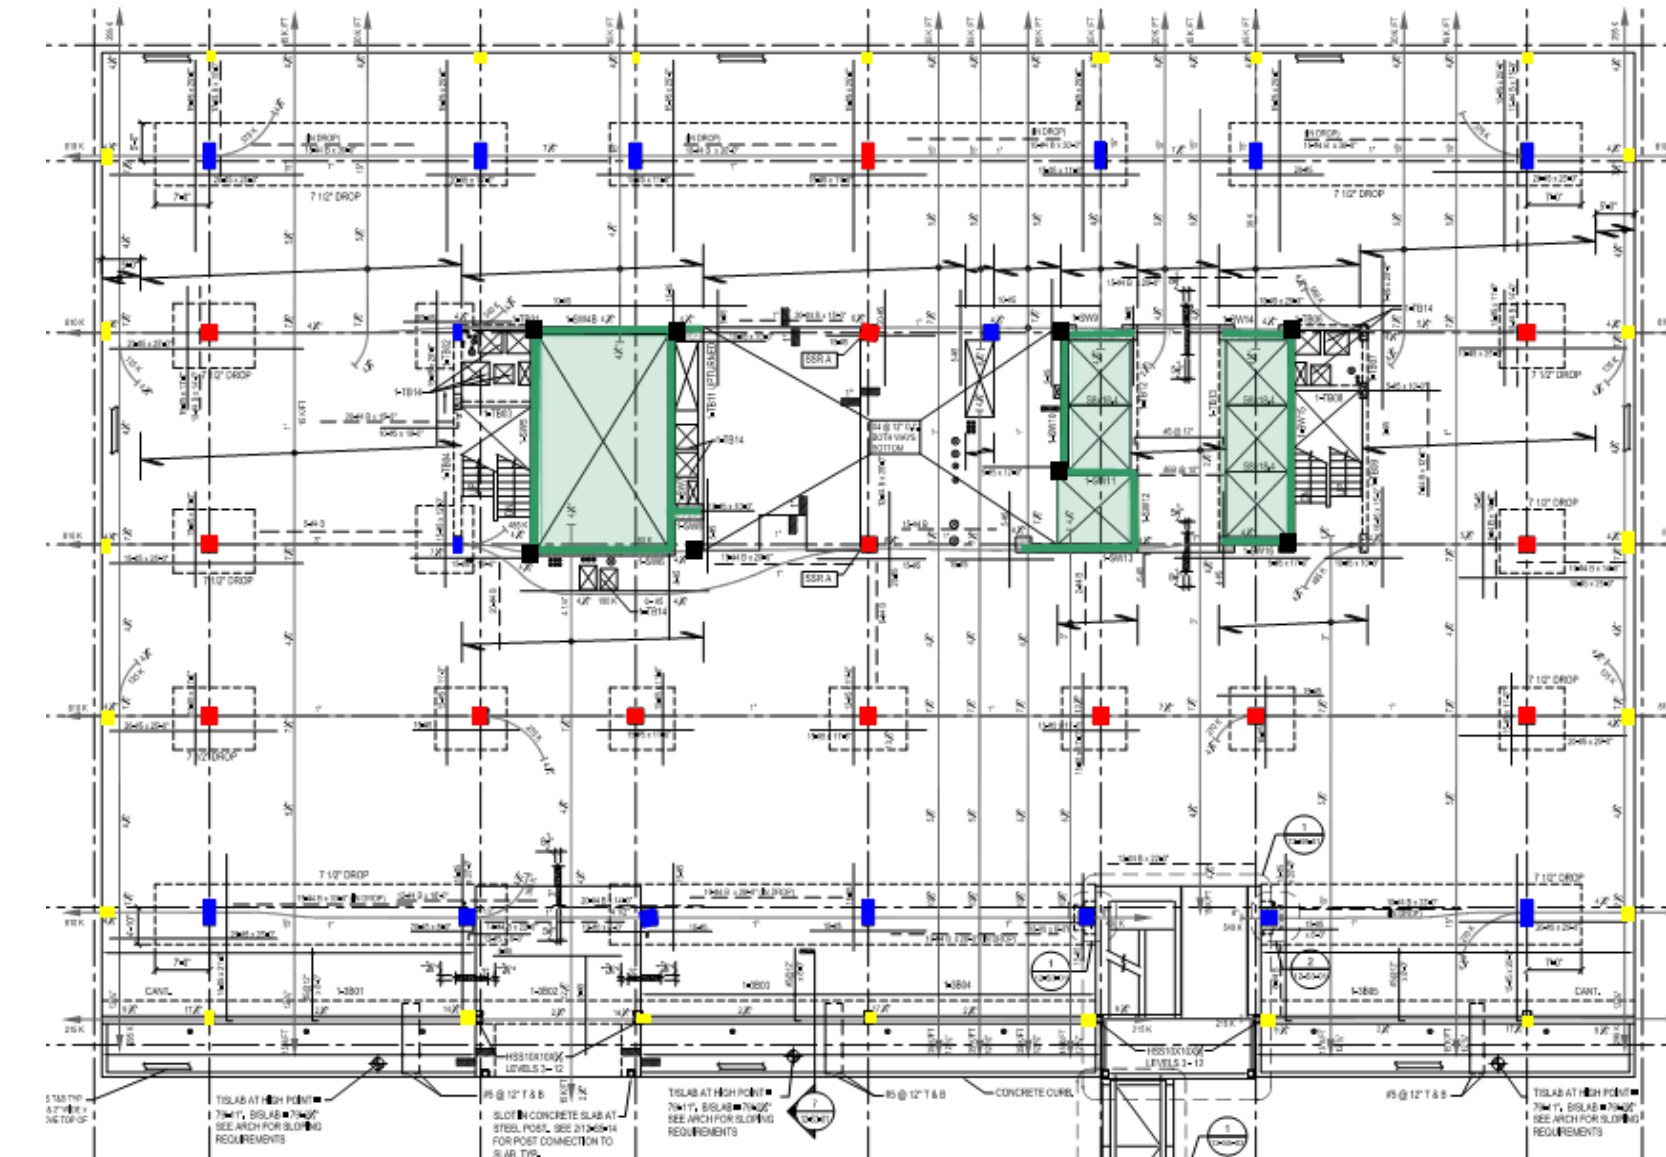

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Proposed Gravity System:

- Three different columns were designed to meet the new loads
  - 18"x18" with 8#6 bars #3 stirrups at 12"
  - 24"x24" with 8#8 bars #4 stirrups at 12"
  - 24"x30" with 12#8 bars #4 stirrups at 12"
- Columns verified through hand calcs and spColumn
- F'c decreases with height similar to existing system

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

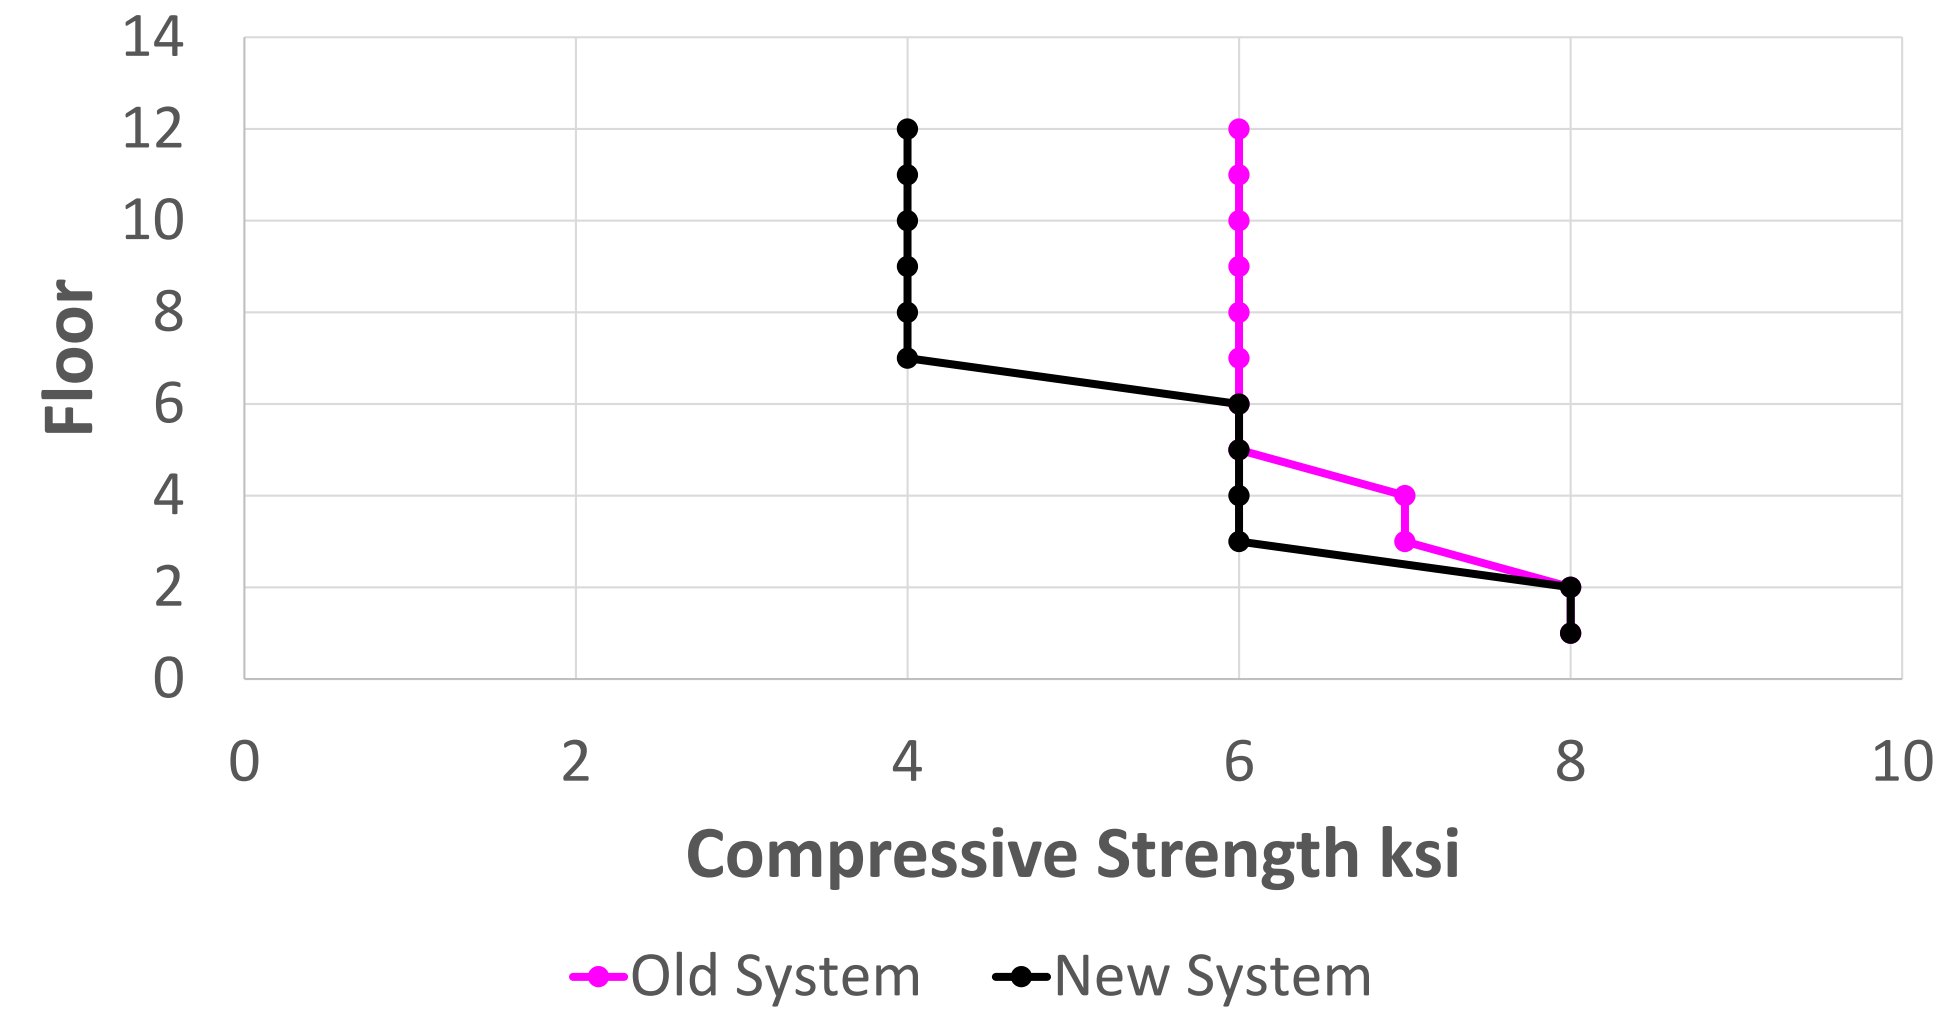

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Height vs Compressive Strength

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

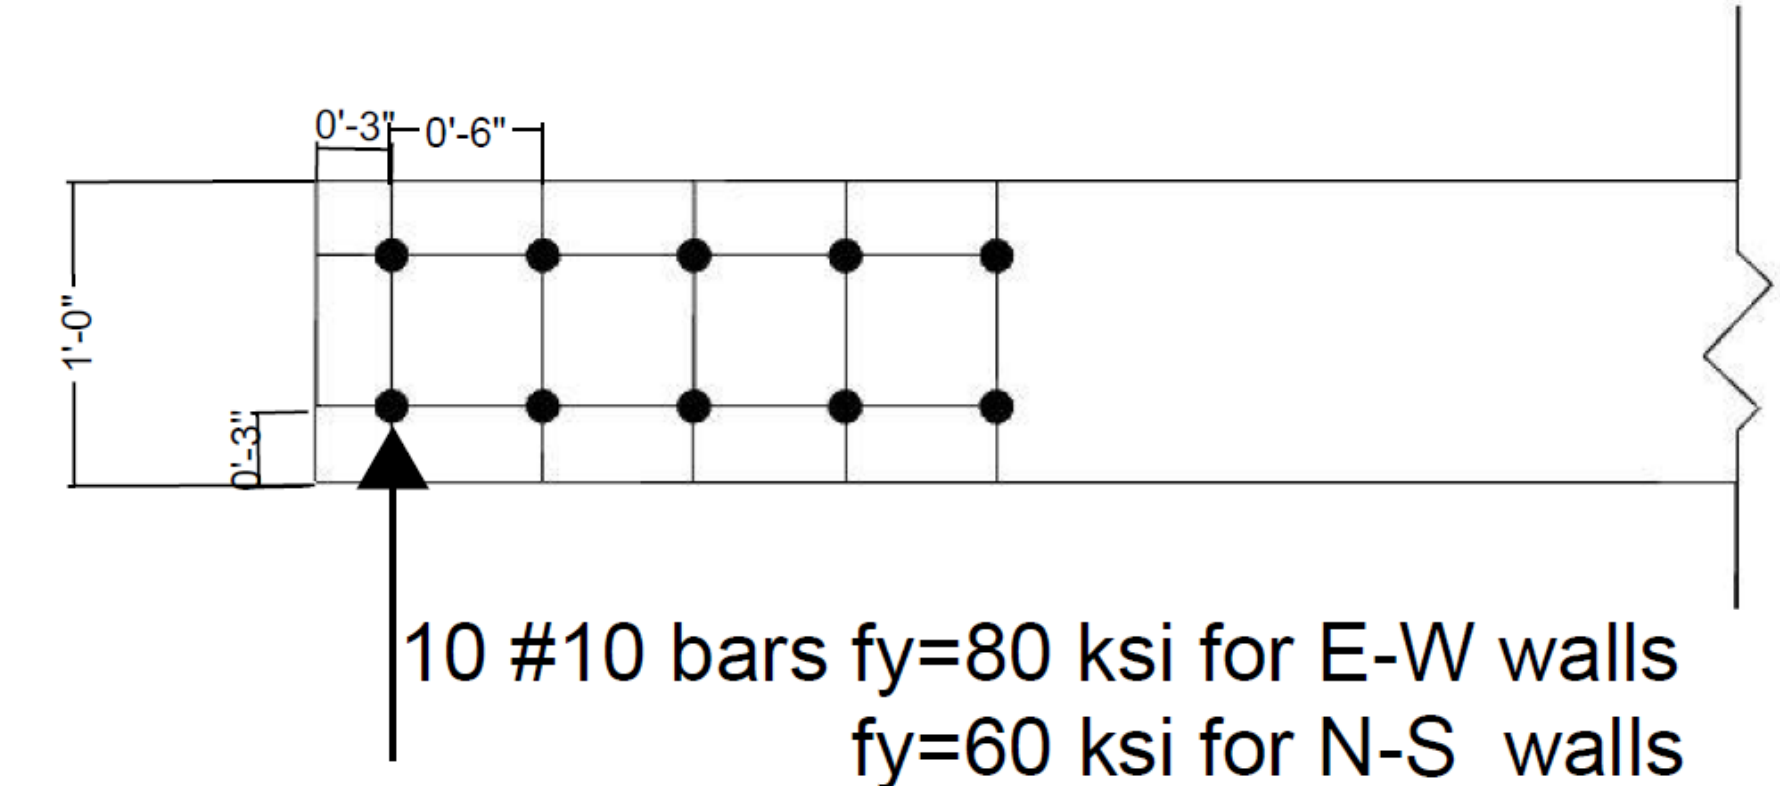

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Proposed Lateral System:

- Shear walls for new system
  - Controlling case was seismic in E-W
  - Thickness increased to 12"
  - 80 ksi steel used
  - Length of wall was not changed

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | **Blast Design** | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### **Blast Design *Research*:**

- Blast design followed *UFC 3-340-02*, structures to resist the effects of accidental explosions, and procedures in the *Handbook for Blast Resistant Design of Buildings*
- Handbook heavily references UFC 3-340-02
- Handbook had empirical procedure for determining the effects of blast

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | **Blast Design** | Progressive Collapse

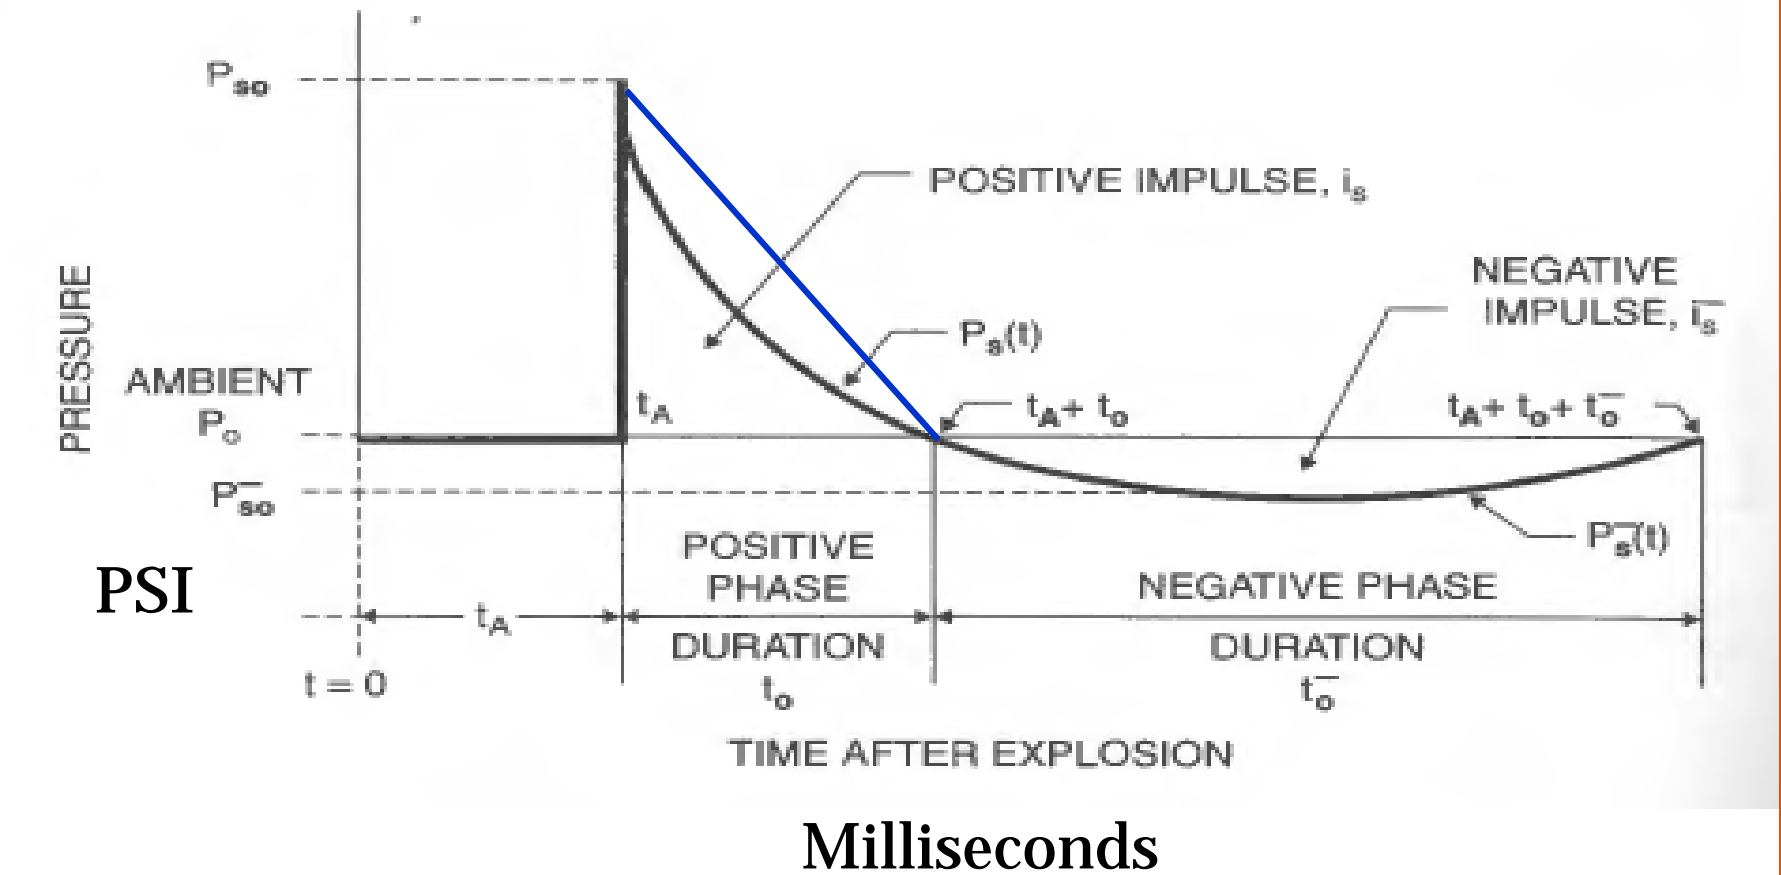

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Blast Design *Effect*:

- Effect of blast has both a positive impulse and negative impulse over time.
- Empirical procedure utilized for simplicity
- Blast acts similar to wind load

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | **Blast Design** | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

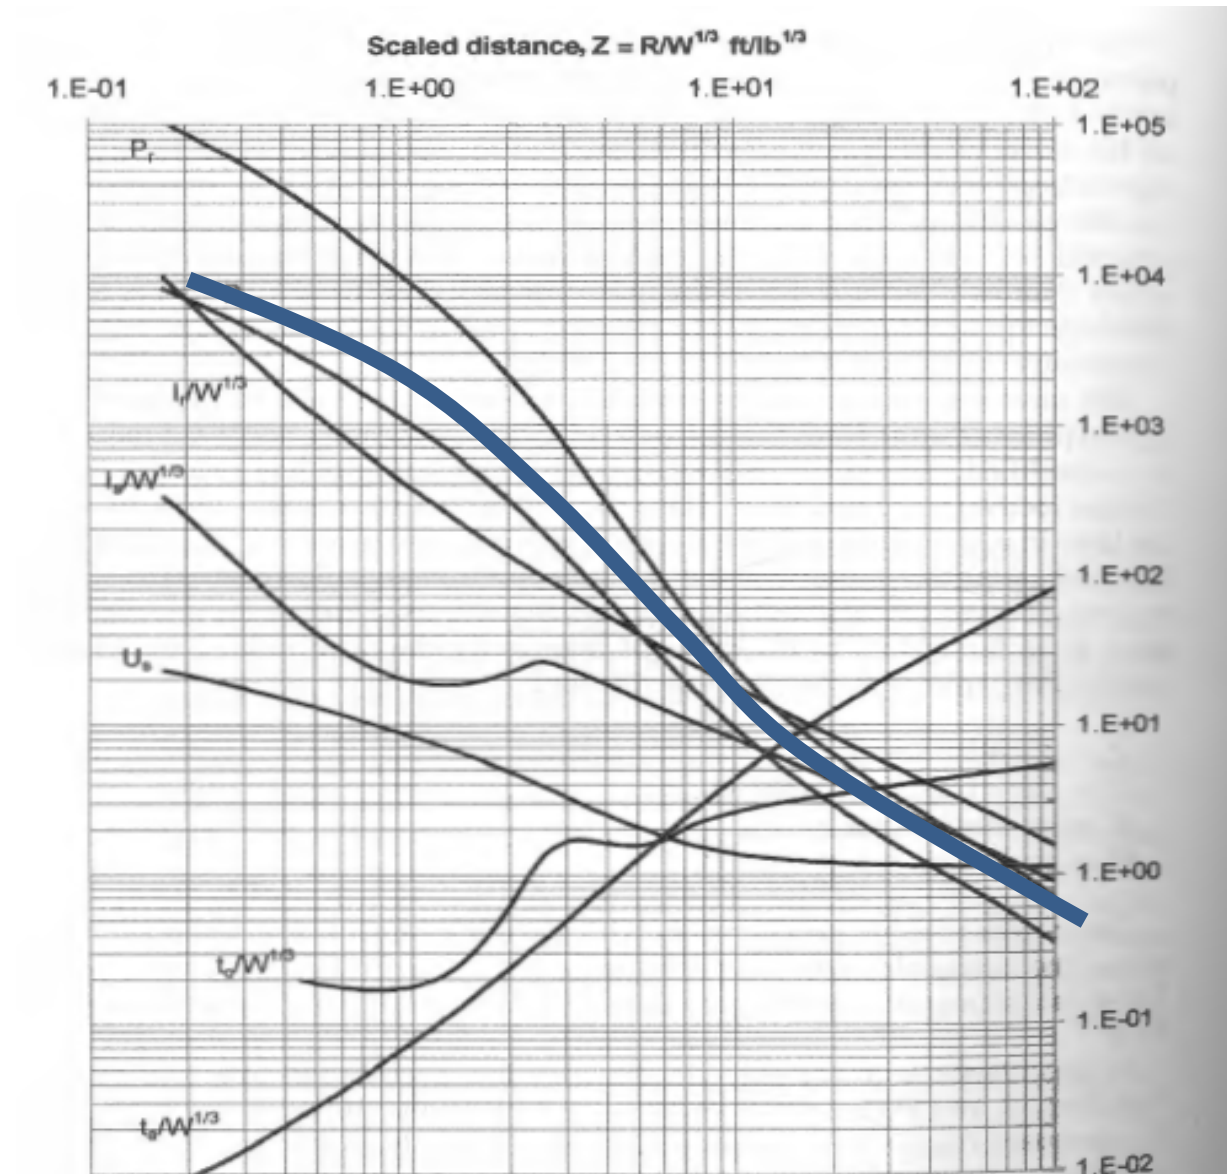

## Conclusion

### Blast Design *Effect*:

- Effect of blast has both a positive impulse and negative impulse over time.
- Empirical procedure utilized for simplicity
- Blast acts similar to wind load
- Pressures are then determined by
  - Mass of the bomb - **W**
  - Distance - **R**
- Scaled distance factor

$$Z = R/W^{1/3}$$

$P_{so}$  = Side-on overpressure

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | **Blast Design** | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### **Blast Design *Intensity*:**

- What kind of bomb would go off
- Search was based on relatively small explosions
- 5 kg bomb was chosen

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | **Blast Design** | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### **Blast Design *Location (Exterior):***

- Initial Exterior Location
  - 2 locations were conceived testing each side of the building
  - pressures were too large  $\approx 65 \text{ psi} = 9360 \text{ lbs/sqft}$

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | **Blast Design** | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### **Blast Design Location (Exterior):**

- Initial Exterior Location
  - 2 locations were conceived testing each side of the building
  - pressures were too large  $\approx 65 \text{ psi} = 9360 \text{ lbs/sqft}$
- Feasible Exterior Location
  - More probable location was conceived
  - Bomb 6ft away from the building would be equivalent to an interior explosion.

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | **Blast Design** | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Blast Design (*Exterior*):

- Modeled as a lateral pressure
- Moment from blast was added to existing moment on exterior column

Load

Moment

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | **Blast Design** | Progressive Collapse

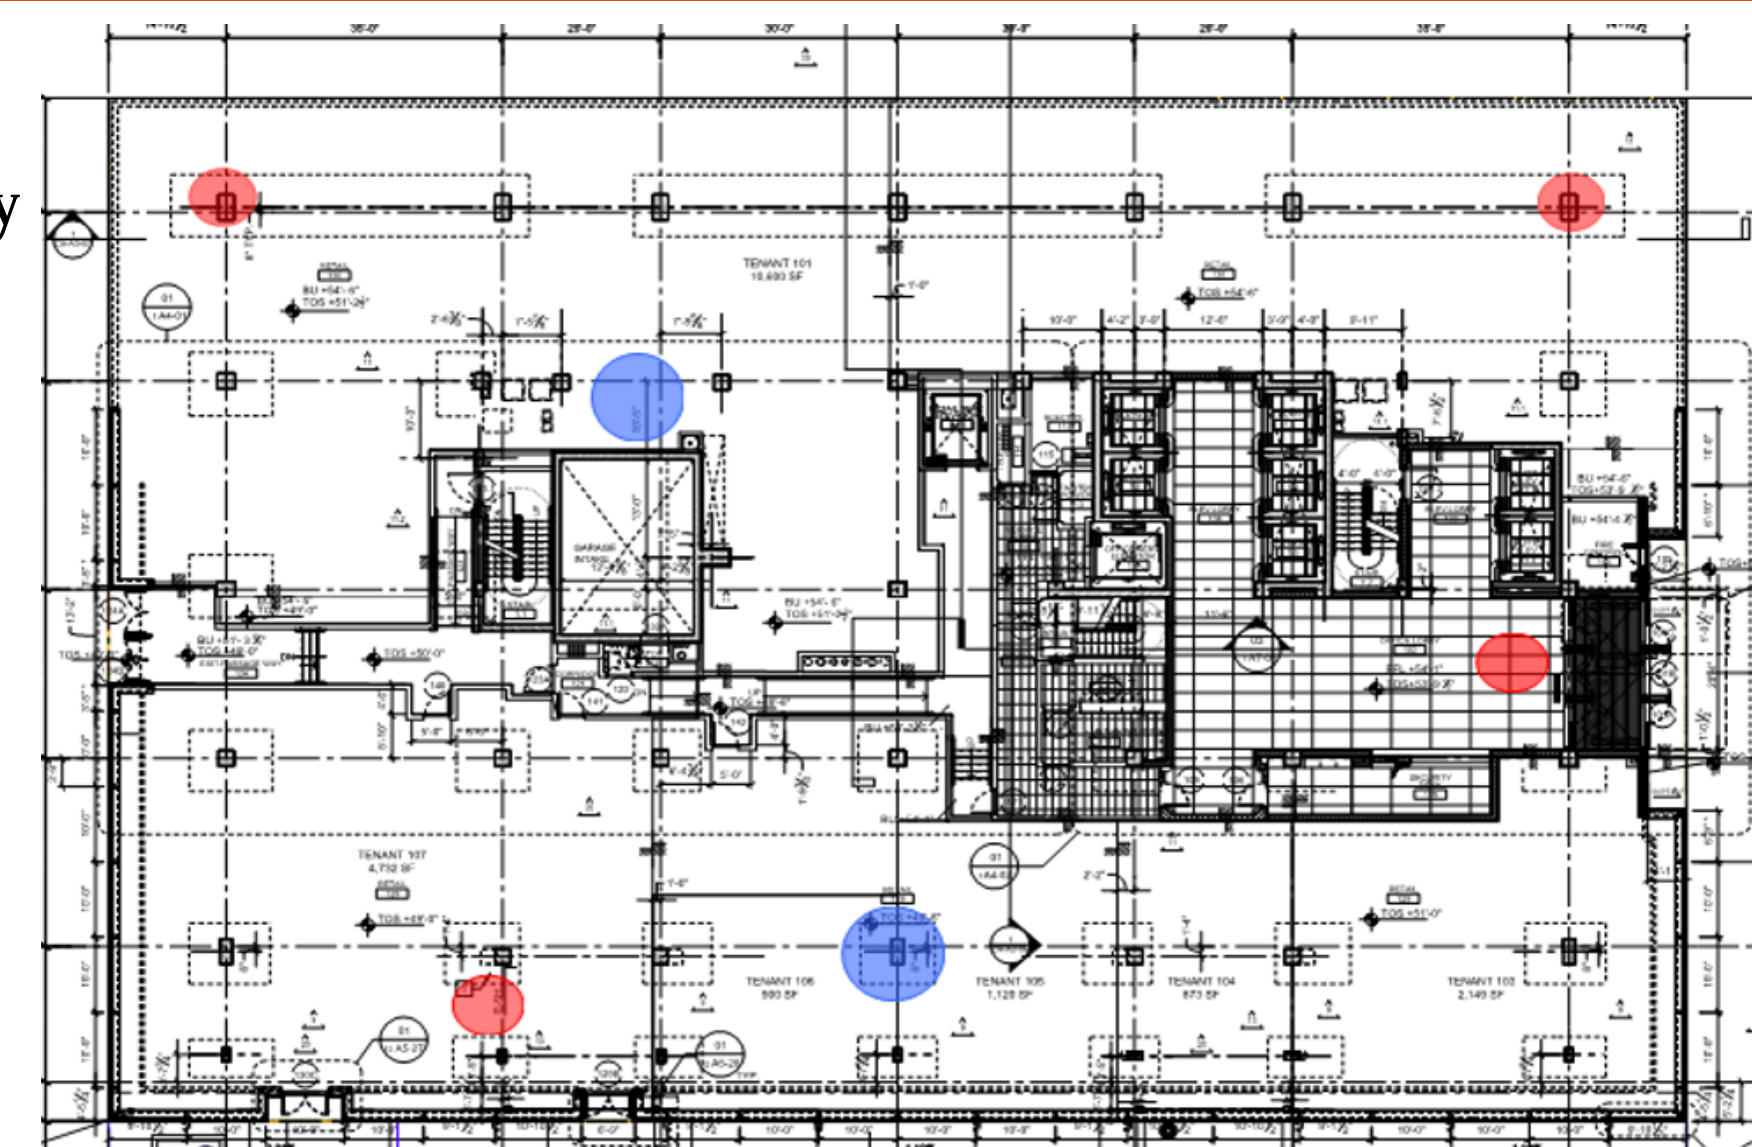

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Blast Design *Location (Interior):*

- Initial Interior Location
  - Based on probability
  - Based on structure
  - Intention was so members could survive 5 kg blast
  - Interior columns could only survive 9ft away
  - Redesign was thought to be unreasonable

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | **Progressive Collapse**

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Progressive Collapse:

- Design conditions
  - Handbook does not specify progressive collapse
  - UFC 3-340-02 states that at minimum there needs to be an “alternate path for specified column and wall removal”
  - 2<sup>nd</sup> floor was designed to transfer load

2<sup>nd</sup> Floor

1<sup>st</sup> Floor

Ground

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | **Progressive Collapse**

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Progressive Collapse *Design*:

- Two systems created
  - First would have added interior columns  
less span = shallower members
  - Second would not have added columns  
larger members tightly spaced

2<sup>nd</sup> Floor

System 2

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | **Progressive Collapse**

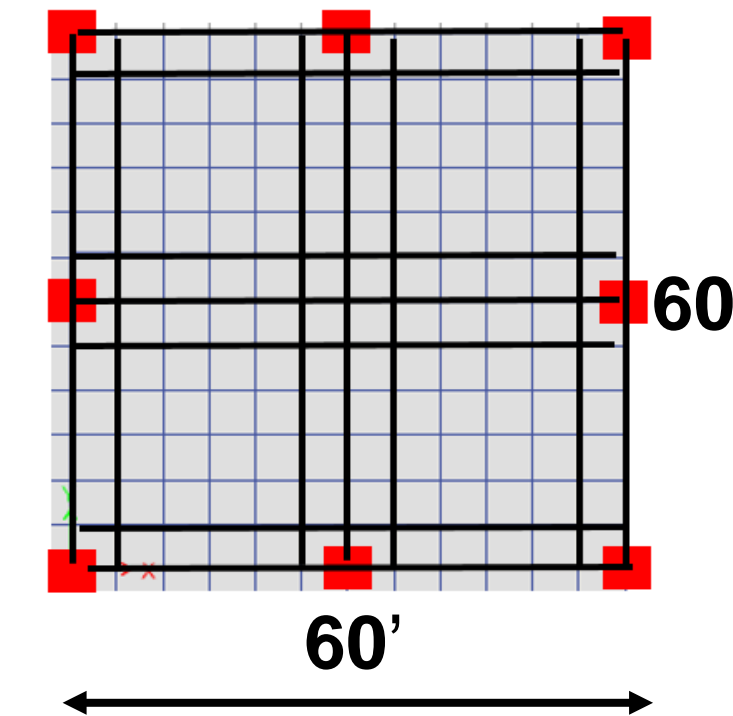

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Progressive Collapse System Comparison:

- System 1
  - Ground floor height 13 ft
  - Additional columns
- System 2
  - Ground floor height 11.5ft
  - Additional beams
- Choice
  - Up to owner or architect?
  - Up to engineer, system 2
- Why
  - Height is sacrificed either way
  - Second system has more capacity to withstand larger bombs

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Construction Breadth:

- Detailed Cost estimate and comparison of all systems
- Duration estimate and comparison of the existing and proposed systems

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Cost comparison:

- Existing systems slab proved to be why it was more expensive.
- Second Progressive collapse system was more expensive due to the larger amount and size of interior beams.

System	Cost
Existing	9.4 million
New	9 million
Progressive Collapse 1	0.48 million
Progressive Collapse 2	1.1 million

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | **Schedule Comparison**

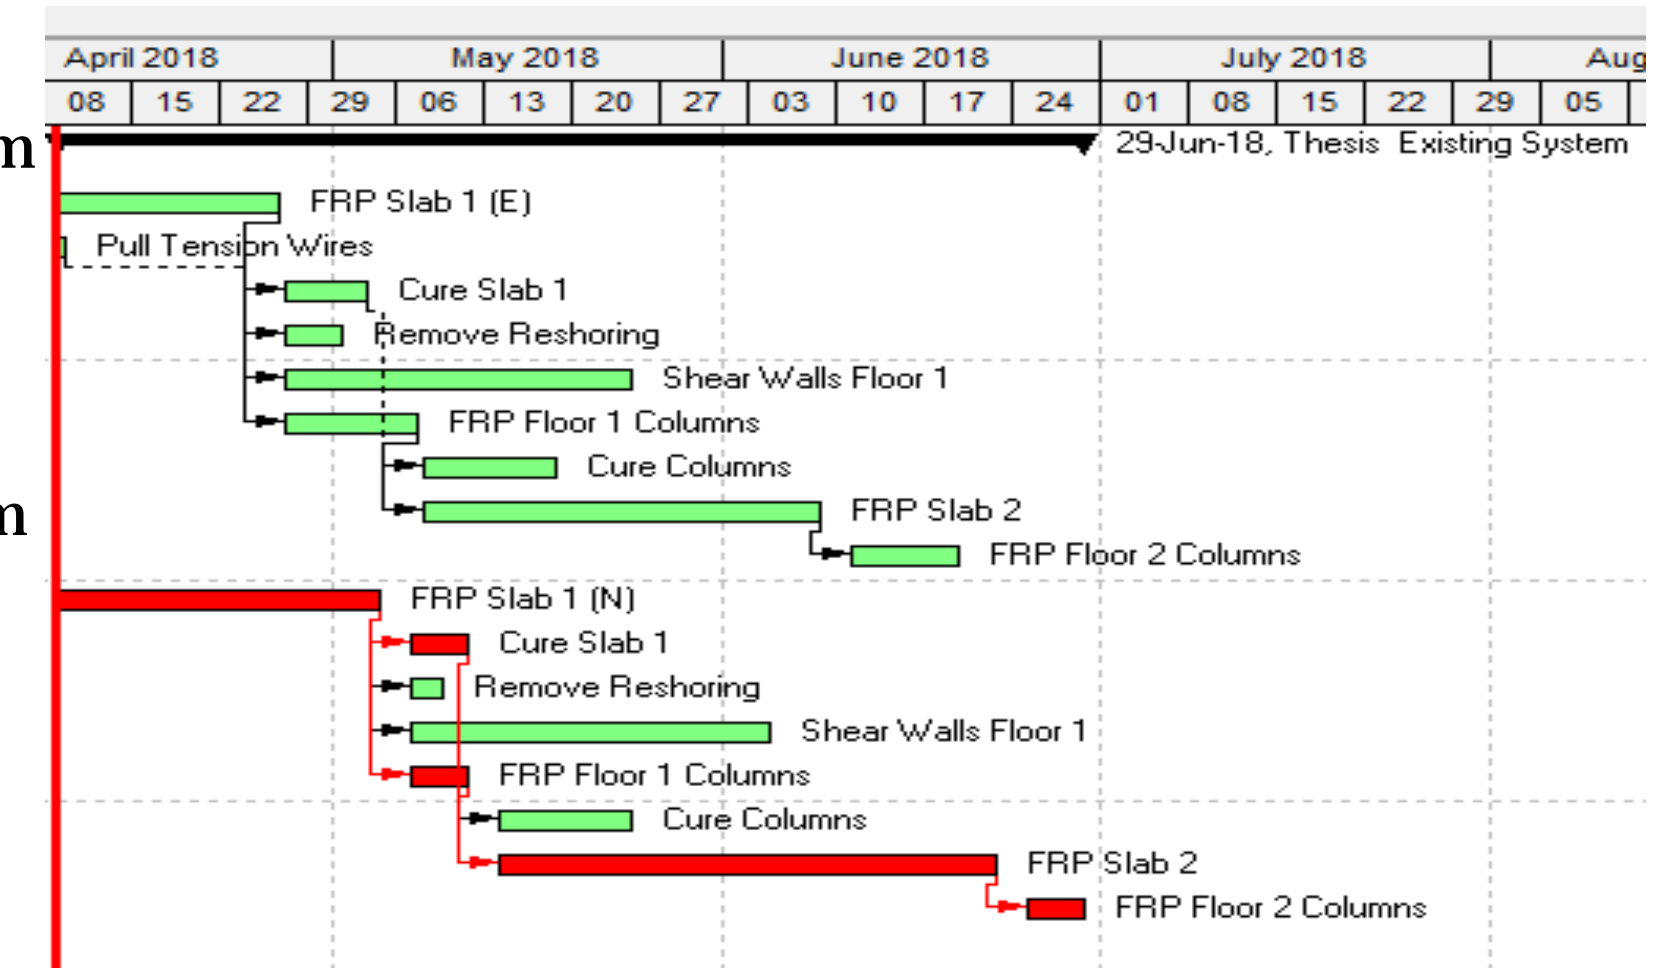

## Conclusion

### Schedule comparison:

- Existing system takes 20 days per floor  
-Overall time 10 month 3 and a half weeks
- New system takes 22 days per floor  
-Overall time 12 months
- Crew sizes were not altered between the two systems.  
-Possible to accelerate time by increasing the cost

Existing System

New System

# One City Center

## Introduction

## Existing System

Gravity System | Lateral System

## Structural Depth

Proposed System | Blast Design | Progressive Collapse

## Construction Breadth

Cost Comparison | Schedule Comparison

## Conclusion

### Conclusion:

- Existing system
  - costs \$400,000 more
- New system
  - takes a month longer
  - increased effective depth by 2 ½ “
  - perimeter columns added
  - increased lateral capacity
  - decrease in needed compressive strength
- Progressive Collapse system
  - support removal of column due to 5kg bomb
  - potential to withstand larger bombs

**Proposed system**

## Cost Evaluation:

- Cost per sqft of entire building from RS means \$131.5 = \$93,365,000 (93 million)
- The structural costs are 9.4 and 9 million resulting in a little over 10% of building cost
- According to RS means structural costs can be somewhere between 14 – 21% of total cost
- Fairly close to statistical percentages
- Differing factors between One city Center and building described in RS means
